

Boom Trucks

Boom Trucks Training Kingston - Boom trucks are often applied by phone, cable television and utilities companies as they have extended folded arms which are typically folded over the roofs of business vans. On the end of the extension of extendable arms usually sits a bucket-like apparatus. When a container truck has an extendable boom installed on the roof this is sometimes called an "aerial boom truck" or a "cherry picker". It is able to transport staff to the top of a phone or utility pole. Bucket boom lift trucks have a hauling capacity of roughly 350 lbs to 1500 lbs or 158 kg to 680 kg and are capable of extending the bucket up to 34 feet or to around 10 meters into the air.

Building boom vehicles or heavy duty boom vehicles will regularly have a crane accessory on the rear. Often labeled knuckle booms, these cranes might be shorter and more compact than the trolley boom, which has a boom capable of extending the length of the truck. Hoist boom vehicles include a lifting capability between 10 to 50 tons or just about 9 to 45 metric tons.

Concrete boom vehicles are another variation. The booms on these lift trucks have a tube with a nozzle at the remote end and are used to pump concrete or other resources. The locations where these resources have to be deposited is oftentimes inaccessible to the truck or is found at a considerable height, for that reason, the boom of a larger concrete boom vehicle may be extended 230 feet or approximately 71 meters. The truck then pumps the material through the boom completely depositing it into the space where it is needed.

Fire departments are outfitted with a lengthy bucket boom used to elevate firefighters to the upper floors of a building. Once in place, this boom enables them to direct water onto a fire or to rescue trapped victims. A lot of the older hook and ladder lift trucks have been replaced with up to date boom vehicles.

Self propelled booms are quite similar to lift trucks. These little boom trucks may raise employees to elevated storage space or to the ceiling of large warehouses and storage offices. They are more secure and as a result far safer than using extension ladders for the same application.
